Chapter 1

Classes

1.1 Classes

We speak informally of *classes*. A class is specified by a unary predicate. We write $\{x \mid P(x)\}$ for the class determined by the predicate $P(x)$.

Definition 1.1.1 (Membership). Let a be an object and \mathbf{A} a class. We define the proposition $a \in \mathbf{A}$ (a is a *member* or *element* of \mathbf{A}) as follows:

The proposition $a \in \{x \mid P(x)\}$ is the proposition $P(a)$.

Definition 1.1.2 (Equality of Classes). Let \mathbf{A} and \mathbf{B} be classes. We say \mathbf{A} and \mathbf{B} are *equal*, $\mathbf{A} = \mathbf{B}$, if and only if they have exactly the same elements.

1.2 Subclasses

Definition 1.2.1 (Subclass). Let \mathbf{A} and \mathbf{B} be classes. We say \mathbf{A} is a *subclass* of \mathbf{B} , $\mathbf{A} \subseteq \mathbf{B}$, if and only if every member of \mathbf{A} is a member of \mathbf{B} .

We say \mathbf{A} is a *proper* subclass of \mathbf{B} , $\mathbf{A} \subset \mathbf{B}$, if and only if $\mathbf{A} \subseteq \mathbf{B}$ and $\mathbf{A} \neq \mathbf{B}$.

1.3 The Empty Class

Definition 1.3.1 (Empty Class). The *empty* class \emptyset is $\{x \mid \perp\}$.

1.4 Finite Classes

Definition 1.4.1. For any objects a_1, \dots, a_n , we write $\{a_1, \dots, a_n\}$ for the class $\{x \mid x = a_1 \vee \dots \vee x = a_n\}$.

1.5 Universal Class

Definition 1.5.1 (Universal Class). The *universal class* \mathbf{V} is the class $\{x \mid \top\}$.

1.6 Union

Definition 1.6.1 (Union). For any classes \mathbf{A} and \mathbf{B} , the *union* $\mathbf{A} \cup \mathbf{B}$ is the class $\{x \mid x \in \mathbf{A} \vee x \in \mathbf{B}\}$.

1.7 Intersection

Definition 1.7.1 (Intersection). For any classes \mathbf{A} and \mathbf{B} , the *intersection* $\mathbf{A} \cap \mathbf{B}$ is the class $\{x \mid x \in \mathbf{A} \wedge x \in \mathbf{B}\}$.

1.8 Relative Complement

Definition 1.8.1 (Relative Complement). For any classes \mathbf{A} and \mathbf{B} , the *relative complement* $\mathbf{A} - \mathbf{B}$ is $\{x \in \mathbf{A} \mid x \notin \mathbf{B}\}$.

Chapter 2

Sets

2.1 Membership

We take as undefined the notion of *set*.

We take as undefined the binary relation of *membership*, \in . If $a \in A$ we say a is a *member* or *element* of A . If this does not hold, we write $a \notin A$.

Axiom 2.1.1 (Axiom of Extensionality). *Two sets with exactly the same elements are equal.*

We may therefore identify the set A with the class $\{x \mid x \in A\}$.

We say a class \mathbf{A} is a *set* iff there exists a set A such that $A = \mathbf{A}$. That is, $\{x \mid P(x)\}$ is a set if and only if there exists a set A such that, for all x , we have $x \in A$ if and only if $P(x)$.

2.2 The Empty Set

Axiom 2.2.1 (Empty Set Axiom). *The empty class \emptyset is a set.*

2.3 Pair Sets

Axiom 2.3.1 (Pairing Axiom). *For any objects u and v , the class $\{u, v\}$ is a set.*

Theorem 2.3.2 (Pairing). *For any object a , the class $\{a\}$ is a set.*

PROOF: It is $\{a, a\}$. \square

2.4 Unions

Definition 2.4.1 (Union). For any class of sets \mathbf{A} , the *union* $\bigcup \mathbf{A}$ is the class $\{x \mid \exists A \in \mathbf{A}. x \in A\}$.

Axiom 2.4.2 (Union Axiom). *For any set A , the union $\bigcup A$ is a set.*

Theorem 2.4.3 (Union, Pairing). *For any sets A and B , the class $A \cup B$ is a set.*

PROOF: It is $\bigcup\{A, B\}$. \square

Theorem Schema 2.4.4 (Union, Pairing). *For any objects a_1, \dots, a_n , the class $\{a_1, \dots, a_n\}$ is a set.*

PROOF: We prove each theorem using the last since $\{a_1, \dots, a_n, a_{n+1}\} = \{a_1, \dots, a_n\} \cup \{a_{n+1}\}$. \square

2.5 Power Set

Definition 2.5.1 (Power Class). For any class \mathbf{A} , the *power class* $\mathcal{P}\mathbf{A}$ is the class of all subsets of \mathbf{A} .

Axiom 2.5.2 (Power Set Axiom). *For any set A , the power class $\mathcal{P}A$ is a set.*

2.6 Covers

Definition 2.6.1 (Cover). Let \mathbf{X} be a class and $\mathcal{A} \subseteq \mathcal{P}\mathbf{X}$. Then \mathcal{A} *covers* \mathbf{X} , or is a *covering* of \mathbf{X} , if and only if $\bigcup \mathcal{A} = \mathbf{X}$.

2.7 Subset Axioms

Axiom Schema 2.7.1 (Subset Axioms, Aussonderung Axioms). *For any classes \mathbf{A} and \mathbf{B} , if $\mathbf{A} \subseteq \mathbf{B}$ and \mathbf{B} is a set then \mathbf{A} is a set.*

Theorem 2.7.2 (Subset). *The universal class \mathbf{V} is not a set.*

PROOF:

$\langle 1 \rangle 1$. ASSUME: \mathbf{V} is a set.

$\langle 1 \rangle 2$. LET: $R = \{x \in \mathbf{V} \mid x \notin x\}$

$\langle 1 \rangle 3$. $R \in R$ if and only if $R \notin R$

$\langle 1 \rangle 4$. Q.E.D.

PROOF: This is a contradiction.

\square

Theorem 2.7.3 (Subset). *If A is a set and \mathbf{B} is a class then $A - \mathbf{B}$ is a set.*

PROOF: It is a subset of A . \square

2.8 Intersection

Definition 2.8.1 (Intersection). For any class \mathbf{A} of sets, the *intersection* $\bigcap \mathbf{A}$ is the class $\{x \mid \forall A \in \mathbf{A}. x \in A\}$.

Theorem 2.8.2 (Subset). *For any nonempty class \mathbf{A} of sets, we have $\bigcap \mathbf{A}$ is a set.*

PROOF:

$\langle 1 \rangle 1.$ PICK $A \in \mathbf{A}$

$\langle 1 \rangle 2.$ $\bigcap \mathbf{A} \subseteq A$

- $\langle 1 \rangle 9.$ $\{\{x\}, \{x, y\}\} \in \mathcal{P}\mathcal{P}C$

□

Lemma 3.1.4 (Pairing, Union). *Let x, y and A be sets. If $(x, y) \in A$ then x and y belong to $\bigcup \bigcup A$.*

PROOF:

- $\langle 1 \rangle 1.$ LET: x, y and A be sets.
- $\langle 1 \rangle 2.$ ASSUME: $(x, y) \in A$
- $\langle 1 \rangle 3.$ $\{x, y\} \in \bigcup A$
- $\langle 1 \rangle 4.$ $x \in \bigcup \bigcup A$
- $\langle 1 \rangle 5.$ $y \in \bigcup \bigcup A$

□

3.2 Cartesian Product

Definition 3.2.1 (Cartesian Product (Pairing)). Let \mathbf{A} and \mathbf{B} be classes. The *Cartesian product* $\mathbf{A} \times \mathbf{B}$ is the class $\{(x, y) \mid x \in \mathbf{A}, y \in \mathbf{B}\}$.

Definition 3.3.1 (Relation (Pairing)). A *relation* is a class of ordered pairs.

Given a relation \mathbf{R} , we write $x\mathbf{R}y$ for $(x, y) \in \mathbf{R}$.

PROOF: Theorems 2.4.3, 3.4.2 and 3.5.2. \square

3.7 Functions

Definition 3.7.1 (Class Term (Pairing)). A *class term* is a relation \mathbf{F} such that, for all x, y, y' , if $x\mathbf{F}y$ and $x\mathbf{F}y'$ then $y = y'$.

If \mathbf{F} is a class term and $x \in \text{dom } \mathbf{F}$, then we write $\mathbf{F}(x)$ for the unique y such that $x\mathbf{F}y$.

We write $\mathbf{F} : \mathbf{A} \rightarrow \mathbf{B}$ iff \mathbf{F} is a class term, $\text{dom } \mathbf{F} = \mathbf{A}$ and $\text{ran } \mathbf{F} \subseteq \mathbf{B}$.

A *function* is a class term that is a set.

1. *The Axiom of Choice*
2. (**Multiplicative Axiom**) *For any function H with domain I such that $H(i)$ is nonempty for all $i \in I$, there exists a function f with domain I such that, for all $i \in I$, we have $f(i) \in H(i)$.*
3. *Every set has a choice function.*

We call a class term *one-to-one*, *injective* or an *injection* if and only if it is single-rooted.

9.18.1 Continuous in Each Variable Separately

Definition 9.18.12 (Continuous in Each Variable Separately). Let $F : X \times Y \rightarrow Z$. Then F is *continuous in each variable separately* if and only if:

- for every $a \in X$ the function $\lambda y \in Y. F(a, y)$ is continuous;
- for every $b \in Y$ the function $\lambda x \in X. F(x, b)$ is continuous.

Proposition 9.18.13. *Let $F : X \times Y \rightarrow Z$. If F is continuous then F is continuous in each variable separately.*

The following example shows that Theorem 9.18.11 fails in the box topology.

The following example shows that Proposition 9.18.10 fails in the box topology.

Example 9.20.7. Give \mathbb{R}^ω the box topology. Let $a_n = (1/n, 1/n, \dots)$ for $n \geq 1$ and $l = (0, 0, \dots)$. Then $\pi_i(a_n) \rightarrow \pi_i(l)$ as $n \rightarrow \infty$ for all i , but $a_n \not\rightarrow l$ as $n \rightarrow \infty$ since the open set

contains l but does not contain any a_n .

Example 9.20.8. The set \mathbb{R}^∞ is closed in \mathbb{R}^ω under the box topology. For let (a_n) be any sequence not in \mathbb{R}^∞ . 9.27 Quotient Topology

Definition 9.27.1 (Quotient Topology). Let X be a topological space, Y a set and $p : X \twoheadrightarrow Y$ be a surjective function. Then the *quotient topology* on Y is the unique topology on Y with respect to which p is a quotient map, namely $\mathcal{T} = \{U \in \mathcal{P}Y \mid p^{-1}(U) \text{ is open in } X\}$.

Definition 9.27.2 (Quotient Space). Let X be a topological space and \sim an equivalence relation on X . Let $p : X \twoheadrightarrow X/\sim$ be the canonical surjection. Then X/\sim under the quotient topology is called a *quotient space*, *identification space* or *decomposition space* of X .

Here is a counterexample showing we cannot remove all the hypotheses of Proposition 9.26.4 except that A is saturated.

Example 9.27.3. Let $X = (0, 1/2] \cup \{1\} \cup \{1 + 1/n : n \geq 2\}$ as a subspace of \mathbb{R} . Define R to be the equivalence relation on X where xRy iff $(x = y \text{ or } |x - y| = 1)$, so we identify $1/n$ with $1 + 1/n$ for all $n \geq 2$. Let Y be the resulting quotient space X/R in the quotient topology and $p : X \twoheadrightarrow Y$ the canonical surjection.

Let $A = \{1\} \cup (0, 1/2] \setminus \{1/n : n \geq 2\} \subseteq X$. Then A is saturated under p but the restriction q of p to A is not a quotient map because it maps the saturated open set $\{1\}$ to $\{1\}$ which is not open in $p(A)$.

Proposition 9.27.4. Let X, Y and Z be topological spaces. Let $f : X \rightarrow Y$ and $g : Y \rightarrow Z$. If f and g are quotient maps then so is $g \circ f$.

PROOF: From Proposition 9.24.3. □

Example 9.27.5. The product of two quotient maps is not necessarily a quotient map.

Let $X = \mathbb{R}$ and X^* the quotient space formed by identifying all positive integers. Let $p : X \twoheadrightarrow X^*$ be the canonical surjection.

We prove $p \times \text{id}_{\mathbb{Q}} : X \times \mathbb{Q} \rightarrow X^* \times \mathbb{Q}$ is not a quotient map.

PROOF:

$\langle 1 \rangle 1. \text{ For } n \geq 1,$

10.1 The Metric Topology

Definition 10.1.1 (Metric). Let X be a set. A *metric* on X is a function $d : X^2 \rightarrow \mathbb{R}$ such that:

1. For all $x, y \in X$, $d(x, y) \geq 0$
2. For all $x, y \in X$, $d(x, y) = 0$ if and only if $x = y$

4. (*Triangle Inequality*) For all $x, y, z \in X$, $d(x, z) \leq d(x, y) + d(y, z)$

We call $d(x, y)$ the *distance* between x and y .

Definition 10.1.2 (Open Ball). Let X be a metric space. Let $a \in X$ and $\epsilon > 0$. The *open ball* with *centre* a and *radius* ϵ is

10.3 The Uniform Topology

Definition 10.3.1 (Uniform Metric). Let J be a set. The *uniform metric* $\bar{\rho}$ on \mathbb{R}^J is defined by

$$\bar{\rho}(a, b) = \sup_{j \in J} \bar{d}(a_j, b_j)$$

where \bar{d} is the standard bounded metric on \mathbb{R} .

The *uniform topology* on \mathbb{R}^J is the topology induced by the uniform metric.

We prove this is a metric.

PROOF:

(1)1. $\bar{\rho}(a, b) \geq 0$

PROOF: Immediate from definitions.

⟨1⟩2. $\bar{\rho}(a, b) = 0$ if and only if $a = b$

PROOF: Immediate from definitions.

⟨1⟩3. $\bar{\rho}(a, b) = \bar{\rho}(b, a)$

PROOF: Immediate from definitions.

⟨1⟩4. $\bar{\rho}(a, c) \leq \bar{\rho}(a, b) + \bar{\rho}(b, c)$

PROOF:

$$\begin{aligned}\bar{\rho}(a, c) &= \sup_{j \in J} \bar{d}(a_j, c_j) \\ &\leq \sup_{j \in J} (\bar{d}(a_j, b_j) + \bar{d}(b_j, c_j)) \\ &\leq \sup_{j \in J} \bar{d}(a_j, b_j) + \sup_{j \in J} \bar{d}(b_j, c_j) \\ &= \bar{\rho}(a, b) + \bar{\rho}(b, c)\end{aligned}$$

Example 10.3.9. The space $[0, 1]^\omega$ under the uniform topology is not locally compact.

It is not compact because the set $\{0, 1\}^\omega$ has no limit point.

Now, assume for a contradiction $[0, 1]^\omega$ is locally compact. Pick $\epsilon > 0$ such that $B(0, \epsilon)$ is included in a compact subspace. Then $\overline{B(0, \epsilon)}$ is compact. In either case $\overline{B(0, \epsilon)} \cong [0, 1]^\epsilon$ which is not compact.

This example shows that we cannot weaken the hypothesis that A is compact to A being closed:

Example 10.9.4. Let $X = \mathbb{R}^2$. Let $A = \{(x, 1/x) \mid x > 0\}$. Let $U = \{(x, y) \mid x > 0, y > 0\}$. Then A is nonempty and closed (Proposition 9.48.14). The set U is open and $A \subseteq U$. But there is no $\epsilon > 0$ such that $U(A, \epsilon) \subseteq U$.

PROOF:
 ⟨1⟩1. LET: $\epsilon > 0$
 ⟨1⟩2. $(2/\epsilon, \epsilon/2) \in A$
 ⟨1⟩3. $(2/\epsilon, 0) \in U(A, \epsilon)$
 ⟨1⟩4. $(2/\epsilon, 0) \notin U$

10.10 Isometry

Definition 10.10.1 (Isometry). Let X be a metric space. An *isometry* of X is a function $f : X \rightarrow X$ such that, for all $x, y \in X$, we have $d(x, y) = d(f(x), f(y))$.

Proposition 10.10.2. *An isometry on a compact metric space is a homeomorphism.*

PROOF:
 ⟨1⟩1. LET: X be a compact metric space.
 ⟨1⟩2. LET: $f : X \rightarrow X$ be an isometry.
 ⟨1⟩3. f is an imbedding
 PROOF: Proposition 10.5.2.
 ⟨1⟩4. f is surjective.
 ⟨2⟩1. ASSUME: for a contradiction $a \notin f(X)$
 ⟨2⟩2. $f(X)$ is closed
 PROOF: Proposition 9.48.12.
 ⟨2⟩3. PICK $\epsilon > 0$ such that $B(a, \epsilon) \cap f(X) = \emptyset$
 ⟨2⟩4. For $m, n \in \mathbb{N}$ with $m \neq n$, we have $d(f^m(a), f^n(a)) \geq \epsilon$
 ⟨3⟩1. ASSUME: without loss of generality $m < n$
 ⟨3⟩2. $d(a, f^{n-m}(a)) \geq \epsilon$
 PROOF: ⟨2⟩3

$\langle 3 \rangle 3.$ $d(f^m(a), f^n(a)) \geq \epsilon$

PROOF: $\langle 1 \rangle 2$

$\langle 2 \rangle 5.$ The sequence $(f^n(a))$ has a convergent subsequence.

PROOF: Corollary 9.46.2.1, $\langle 1 \rangle 1$, Corollary 10.1.19.1.

$\langle 2 \rangle 6.$ Q.E.D.

PROOF: $\langle 2 \rangle 4$ and $\langle 2 \rangle 5$ form a contradiction.

10.11 Shrinking Maps

Definition 10.11.1 (Shrinking Map). Let X be a metric space. Let $f : X \rightarrow X$. Then f is a *shrinking map* if and only if, for all $x, y \in X$ with $x \neq y$, we have $d(f(x), f(y)) < d(x, y)$.

Proposition 10.11.2. Let X be a compact metric space. Let $f : X \rightarrow X$ be a contraction. Then f has a unique fixed point.

PROOF:

$\langle 1 \rangle 1.$ LET: $A_n = f^n(X)$ for $n \geq 1$

$\langle 1 \rangle 2.$ For all $n \geq 1$ we have A_n is closed.

PROOF: Proposition 9.48.12.

$\langle 1 \rangle 3.$ LET: $A = \bigcap_{n=1}^{\infty} A_n$

$\langle 1 \rangle 4.$ PICK $a \in A$

PROOF: Proposition 9.47.6.

$\langle 1 \rangle 5.$ $f(A) = A$

$\langle 2 \rangle 1.$ $f(A) \subseteq A$

$\langle 2 \rangle 2.$ $A \subseteq f(A)$

$\langle 3 \rangle 1.$ LET: $x \in A$

$\langle 3 \rangle 2.$ For $n \geq 1$, PICK x_n such that $x = f^n(x_n)$

$\langle 3 \rangle 3.$ PICK a convergent subsequence $(f^{n_r-1}(x_{n_r}))$ of $(f^{n-1}(x_n))$ with limit l

PROOF: Corollary 9.46.2.1.

$\langle 3 \rangle 4.$ $f(l) = x$

PROOF: Both are the limit of $f(f^{n_r-1}(a_{n_r})) = f^{n_r}(a_{n_r})$.

$\langle 3 \rangle 5.$ $l \in A$

$\langle 4 \rangle 1.$ ASSUME: for a contradiction $l \notin A$

$\langle 4 \rangle 2.$ PICK N such that $l \notin A_N$

$\langle 4 \rangle 3.$ PICK R such that $n_R > N$

$\langle 4 \rangle 4.$ For $r \geq R$ we have $f^{n_r-1}(a_{n_r}) \in A_N$

$\langle 4 \rangle 5.$ Q.E.D.

PROOF: This is a contradiction.

$\langle 1 \rangle 6.$ $\text{diam } A = A$

$\langle 2 \rangle 1.$ PICK $x, y \in A$ such that $d(x, y) = \text{diam } A$

PROOF: By the Extreme Value Theorem.

$\langle 2 \rangle 2.$ PICK $x', y' \in A$ such that $x = f(x')$ and $y = f(y')$

PROOF: By $\langle 1 \rangle 5$.

$\langle 2 \rangle 3$. $x' = y'$

PROOF: If $x' \neq y'$ then $\text{diam } A = d(x, y) < d(x', y')$ which is a contradiction.

$\langle 2 \rangle 4$. $x = y$

$\langle 1 \rangle 7$. $f(a) = a$

PROOF: Since $a, f(a) \in A$

$\langle 1 \rangle 8$. If $f(b) = b$ then $b = a$

PROOF: If $f(b) = b$ then $b \in A$.

The following example shows that we cannot weaken the hypothesis from ' X is a compact metric space' to ' X is a complete metric space'.

Example 10.11.3. The function $f : \mathbb{R} \rightarrow \mathbb{R}$ defined by $f(x) = [x + (x^2 + 1)^{1/2}]/2$ is a shrinking map with no fixed point.

10.12 Contractions

Definition 10.12.1 (Contraction). Let X be a metric space. Let $f : X \rightarrow X$. Then f is a *contraction* if and only if there exists $\alpha < 1$ such that, for all $x, y \in X$, we have $d(f(x), f(y)) \leq \alpha d(x, y)$.
