Part I Set Theory

Chapter 1

Classes

1.1 Classes

We speak informally of *classes*. A class is specified by a unary predicate. We write $\{x \mid P(x)\}$ for the class determined by the predicate P(x).

Definition 1.1.1 (Membership). Let a be an object and \mathbf{A} a class. We define the proposition $a \in \mathbf{A}$ (a is a member or element of A) as follows:

The proposition $a \in \{x \mid P(x)\}$ is the proposition P(a).

Definition 1.1.2 (Equality of Classes). Let A and B be classes. We say A and B are equal, A = B, if and only if they have exactly the same elements.

1.2 Subclasses

Definition 1.2.1 (Subclass). Let **A** and **B** be classes. We say **A** is a *subclass* of **B**, $\mathbf{A} \subseteq \mathbf{B}$, if and only if every member of **A** is a member of **B**.

We say **A** is a *proper* subclass of **B**, **A** \subset **B**, if and only if **A** \subseteq **B** and **A** \neq **B**.

1.3 The Empty Class

Definition 1.3.1 (Empty Class). The *empty* class \emptyset is $\{x \mid \bot\}$.

1.4 Finite Classes

Definition 1.4.1. For any objects a_1, \ldots, a_n , we write $\{a_1, \ldots, a_n\}$ for the class $\{x \mid x = a_1 \lor \cdots \lor x = a_n\}$.

1.5 Universal Class

Definition 1.5.1 (Universal Class). The universal class V is the class $\{x \mid \top\}$.

1.6 Union

Definition 1.6.1 (Union). For any classes **A** and **B**, the *union* $\mathbf{A} \cup \mathbf{B}$ is the class $\{x \mid x \in \mathbf{A} \lor x \in \mathbf{B}\}.$

1.7 Intersection

Definition 1.7.1 (Intersection). For any classes **A** and **B**, the *intersection* $\mathbf{A} \cap \mathbf{B}$ is the class $\{x \mid x \in \mathbf{A} \land x \in \mathbf{B}\}.$

1.8 Relative Complement

Definition 1.8.1 (Relative Complement). For any classes **A** and **B**, the *relative* complement $\mathbf{A} - \mathbf{B}$ is $\{x \in \mathbf{A} \mid x \notin \mathbf{B}\}$.

Chapter 2

Sets

2.1 Membership

We take as undefined the notion of set.

We take as undefined the binary relation of membership, \in . If $a \in A$ we say a is a member or element of A. If this does not hold, we write $a \notin A$.

Axiom 2.1.1 (Axiom of Extensionality). Two sets with exactly the same elements are equal.

We may therefore identify the set A with the class $\{x \mid x \in A\}$.

We say a class **A** is a set iff there exists a set A such that $A = \mathbf{A}$. That is, $\{x \mid P(x)\}$ is a set if and only if there exists a set A such that, for all x, we have $x \in A$ if and only if P(x).

2.2 The Empty Set

Axiom 2.2.1 (Empty Set Axiom). The empty class \emptyset is a set.

2.3 Pair Sets

Axiom 2.3.1 (Pairing Axiom). For any objects u and v, the class $\{u, v\}$ is a set

Theorem 2.3.2 (Pairing). For any object a, the class $\{a\}$ is a set.

PROOF: It is $\{a, a\}$. \square

2.4 Unions

Definition 2.4.1 (Union). For any class of sets **A**, the *union* \bigcup **A** is the class $\{x \mid \exists A \in \mathbf{A}. x \in A\}.$

Axiom 2.4.2 (Union Axiom). For any set A, the union $\bigcup A$ is a set.

Theorem 2.4.3 (Union, Pairing). For any sets A and B, the class $A \cup B$ is a set.

PROOF: It is $\bigcup \{A, B\}$. \square

Theorem Schema 2.4.4 (Union, Pairing). For any objects a_1, \ldots, a_n , the class $\{a_1, \ldots, a_n\}$ is a set.

PROOF: We prove each theorem using the last since $\{a_1, \ldots, a_n, a_{n+1}\} = \{a_1, \ldots, a_n\} \cup \{a_{n+1}\}$. \square

2.5 Power Set

Definition 2.5.1 (Power Class). For any class A, the *power* class $\mathcal{P}A$ is the class of all subsets of A.

Axiom 2.5.2 (Power Set Axiom). For any set A, the power class PA is a set.

2.6 Covers

Definition 2.6.1 (Cover). Let **X** be a class and $A \subseteq \mathcal{P}\mathbf{X}$. Then A covers **X**, or is a covering of **X**, if and only if $\bigcup A = \mathbf{X}$.

2.7 Subset Axioms

Axiom Schema 2.7.1 (Subset Axioms, Aussonderung Axioms). For any classes **A** and **B**, if $A \subseteq B$ and **B** is a set then **A** is a set.

Theorem 2.7.2 (Subset). The universal class V is not a set.

Proof:

- $\langle 1 \rangle 1$. Assume: **V** is a set.
- $\langle 1 \rangle 2$. Let: $R = \{ x \in \mathbf{V} \mid x \notin x \}$
- $\langle 1 \rangle 3$. $R \in R$ if and only if $R \notin R$
- $\langle 1 \rangle 4$. Q.E.D.

Proof: This is a contradiction.

П

Theorem 2.7.3 (Subset). If A is a set and B is a class then A - B is a set.

PROOF: It is a subset of A. \square

2.8 Intersection

Definition 2.8.1 (Intersection). For any class **A** of sets, the *intersection* \bigcap **A** is the class $\{x \mid \forall A \in \mathbf{A}. x \in A\}$.

Theorem 2.8.2 (Subset). For any nonempty class A of sets, we have $\bigcap A$ is a set.

Proof:

- $\langle 1 \rangle 1$. Pick $A \in \mathbf{A}$
- $\langle 1 \rangle 2. \cap \mathbf{A} \subseteq A$
- $\langle 1 \rangle 3$. Q.E.D.

PROOF: By a Subset Axiom.

П

Theorem 2.8.3 (Subset). For any sets A and B, the class $A \cap B$ is a set.

PROOF: From a Subset Axiom since $A \cap B \subseteq A$. \square

Chapter 3

Relations

3.1 Ordered Pairs

Definition 3.1.1 (Ordered Pair (Pairing)). For any sets x and y, the *ordered pair* (x,y) is defined to be $\{\{x\},\{x,y\}\}.$

Theorem 3.1.2 (Pairing). For any sets u, v, x, y, we have (u, v) = (x, y) if and only if u = x and v = y

```
Proof:
\langle 1 \rangle 1. Assume: \{\{u\}, \{u, v\}\} = \{\{x\}, \{x, y\}\}
\langle 1 \rangle 2. \ \{u\} \in \{\{x\}, \{x, y\}\}\
\langle 1 \rangle 3. \ \{u, v\} \in \{\{x\}, \{x, y\}\}\
\langle 1 \rangle 4. \ \{u\} = \{x\} \text{ or } \{u\} = \{x, y\}
\langle 1 \rangle 5. \ \{u, v\} = \{x\} \text{ or } \{u, v\} = \{x, y\}
\langle 1 \rangle 6. Case: \{u\} = \{x, y\}
    \langle 2 \rangle 1. \ u = x = y
   \langle 2 \rangle 2. u = v = x = y
       PROOF: From \langle 1 \rangle 5
\langle 1 \rangle 7. Case: \{u, v\} = \{x\}
   PROOF: Similar.
\langle 1 \rangle 8. Case: \{u\} = \{x\} \text{ and } \{u, v\} = \{x, y\}
    \langle 2 \rangle 1. \ u = x
    \langle 2 \rangle 2. u = y or v = y
   \langle 2 \rangle 3. Case: u = y
       PROOF: This case is the case considered in \langle 1 \rangle 6.
   \langle 2 \rangle 4. Case: v = y
       PROOF: We have u = x and v = y as required.
```

Lemma 3.1.3 (Pairing, Power Set). Let x, y and C be sets. If $x \in C$ and $y \in C$ then $(x, y) \in \mathcal{PPC}$.

Proof:

```
\begin{split} &\langle 1 \rangle 1. \text{ Let: } x, y \text{ and } C \text{ be sets.} \\ &\langle 1 \rangle 2. \text{ Assume: } x \in C \\ &\langle 1 \rangle 3. \text{ Assume: } y \in C \\ &\langle 1 \rangle 4. \quad \{x\} \subseteq C \\ &\langle 1 \rangle 5. \quad \{x,y\} \subseteq C \\ &\langle 1 \rangle 6. \quad \{x\} \in \mathcal{P}C \\ &\langle 1 \rangle 7. \quad \{x,y\} \in \mathcal{P}C \\ &\langle 1 \rangle 8. \quad \{\{x\},\{x,y\}\} \subseteq \mathcal{P}C \\ &\langle 1 \rangle 9. \quad \{\{x\},\{x,y\}\} \in \mathcal{PP}C \\ &\Box \end{split}
```

Lemma 3.1.4 (Pairing, Union). Let x, y and A be sets. If $(x, y) \in A$ then x and y belong to $\bigcup \bigcup A$.

```
Proof:
```

```
\begin{array}{ll} \langle 1 \rangle 1. & \text{Let: } x, y \text{ and } A \text{ be sets.} \\ \langle 1 \rangle 2. & \text{Assume: } (x,y) \in A \\ \langle 1 \rangle 3. & \{x,y\} \in \bigcup A \\ \langle 1 \rangle 4. & x \in \bigcup \bigcup A \\ \langle 1 \rangle 5. & y \in \bigcup \bigcup A \\ & & \\ & & \\ & & \\ & & \\ \end{array}
```

3.2 Cartesian Product

Definition 3.2.1 (Cartesian Product (Pairing)). Let **A** and **B** be classes. The Cartesian product $\mathbf{A} \times \mathbf{B}$ is the class $\{(x,y) \mid x \in \mathbf{A}, y \in \mathbf{B}\}$.

Theorem 3.2.2 (Pairing, Union, Power Set, Subset). For any sets A and B, the Cartesian product $A \times B$ is a set.

PROOF: It is a subset of $\mathcal{PP}(A \cup B)$ by Lemma 3.1.3. \sqcup

3.3 Relations

Definition 3.3.1 (Relation (Pairing)). A relation is a class of ordered pairs. Given a relation \mathbf{R} , we write $x\mathbf{R}y$ for $(x,y) \in \mathbf{R}$. A relation is small iff it is a set.

3.4 Domain

Definition 3.4.1 (Domain (Pairing)). Let **R** be a class. The *domain* of **R** is dom $\mathbf{R} = \{x \mid \exists y. x \mathbf{R} y\}$.

Theorem 3.4.2 (Pairing, Union, Subset). For any set R, the domain dom R is a set.

PROOF: It is a subset of $\bigcup \bigcup R$ by Lemma 3.1.4. \square

3.5 Range

Definition 3.5.1 (Domain (Pairing)). Let **R** be a class. The *range* of **R** is $\operatorname{ran} \mathbf{R} = \{y \mid \exists x. x \mathbf{R} y\}.$

Theorem 3.5.2 (Pairing, Union, Subset). For any set R, the range ran R is a set.

PROOF: It is a subset of $\bigcup \bigcup R$ by Lemma 3.1.4. \square

3.6 Field

Definition 3.6.1 (Field). Let **R** be a class. The *field* of **R** is fld $\mathbf{R} = \operatorname{dom} \mathbf{R} \cup \operatorname{ran} \mathbf{R}$.

Theorem 3.6.2 (Pairing, Union, Subset). For any set R, the field fld R is a set

PROOF: Theorems 2.4.3, 3.4.2 and 3.5.2. \square

3.7 Functions

Definition 3.7.1 (Class Term (Pairing)). A *class term* is a relation **F** such that, for all x, y, y', if x**F**y and x**F**y' then y = y'.

If **F** is a class term and $x \in \text{dom } \mathbf{F}$, then we write $\mathbf{F}(x)$ for the unique y such that $x\mathbf{F}y$.

We write $\mathbf{F} : \mathbf{A} \to \mathbf{B}$ iff \mathbf{F} is a class term, dom $\mathbf{F} = \mathbf{A}$ and ran $\mathbf{F} \subseteq \mathbf{B}$. A function is a class term that is a set.

Axiom 3.7.2 (Axiom of Choice, First Form (Pairing)). For any relation R, there exists a function $H \subseteq R$ such that dom H = dom R.

Theorem 3.7.3. The following are equivalent.

- 1. The Axiom of Choice
- 2. (Multiplicative Axiom) For any function H with domain I such that H(i) is nonempty for all $i \in I$, there exists a function f with domain I such that, for all $i \in I$, we have $f(i) \in H(i)$.
- 3. Every set has a choice function.
- 4. Let A be a set of pairwise disjoint nonempty sets. Then there exists a set C containing exactly one element from each member of A.

3.8 Single-Rooted

Definition 3.8.1 (Single-Rooted (Pairing)). A class **R** is *single-rooted* if and only if, for all x, x', y, if x**R**y and x'**R**y then x = x'.

We call a class term *one-to-one*, *injective* or an *injection* if and only if it is single-rooted.

3.9 Surjective

Definition 3.9.1 (Surjective (Pairing)). Let $\mathbf{F} : \mathbf{A} \to \mathbf{B}$. Then \mathbf{F} is *surjective* if and only if ran $\mathbf{F} = \mathbf{B}$.

3.10 Inverse

Definition 3.10.1 (Inverse (Pairing)). Let **R** be a class. The *inverse* of **R** is $\mathbf{R}^{-1} = \{(y, x) \mid x\mathbf{R}y\}.$

Theorem 3.10.2 (Pairing, Union, Power Set, Subset). For any set R, the inverse R^{-1} is a set.

PROOF: It is a subset of ran $R \times \text{dom } R$. \square

Theorem 3.10.3 (Pairing). For any class \mathbf{F} , we have dom $\mathbf{F}^{-1} = \operatorname{ran} \mathbf{F}$.

PROOF: For any x, we have

$$x \in \text{dom } \mathbf{F}^{-1} \Leftrightarrow \exists y. (x, y) \in \mathbf{F}^{-1}$$

 $\Leftrightarrow \exists y. (y, x) \in \mathbf{F}$
 $\Leftrightarrow x \in \text{ran } \mathbf{F}$

Theorem 3.10.4 (Pairing). For any set \mathbf{F} , we have ran $\mathbf{F}^{-1} = \operatorname{dom} \mathbf{F}$.

PROOF: For any x, we have

$$x \in \operatorname{ran} \mathbf{F}^{-1} \Leftrightarrow \exists y. (y, x) \in \mathbf{F}^{-1}$$

 $\Leftrightarrow \exists y. (x, y) \in \mathbf{F}$
 $\Leftrightarrow x \in \operatorname{dom} \mathbf{F}$

Theorem 3.10.5 (Pairing). For any relation \mathbf{F} , we have $(\mathbf{F}^{-1})^{-1} = \mathbf{F}$.

PROOF: For any z we have

$$z \in (\mathbf{F}^{-1})^{-1} \Leftrightarrow \exists x, y.z = (x, y) \land (y, x) \in \mathbf{F}^{-1}$$
$$\Leftrightarrow \exists x, y.z = (x, y) \land (x, y) \in \mathbf{F}$$
$$\Leftrightarrow z \in \mathbf{F}$$
 (F is a relation)

Theorem 3.10.6 (Pairing). For any class \mathbf{F} , we have \mathbf{F}^{-1} is a class term if and only if \mathbf{F} is single-rooted.

PROOF: Immediate from definitions.

Theorem 3.10.7 (Pairing). Let \mathbf{F} be a relation. Then \mathbf{F} is a class term if and only if \mathbf{F}^{-1} is single-rooted.

PROOF: Immediate from definitions. \Box

Theorem 3.10.8 (Pairing). Let **F** be a one-to-one class term and $x \in \text{dom } \mathbf{F}$. Then $\mathbf{F}^{-1}(\mathbf{F}(x)) = x$.

PROOF: We have $(x, \mathbf{F}(x)) \in \mathbf{F}$ and so $(\mathbf{F}(x), x) \in \mathbf{F}^{-1}$. \square

Theorem 3.10.9 (Pairing). Let **F** be a one-to-one function and $y \in \operatorname{ran} \mathbf{F}$. Then $\mathbf{F}(\mathbf{F}^{-1}(y)) = y$.

PROOF: From Theorems 3.10.3, 3.10.5 and 3.10.8. \square

3.11 Composition

Definition 3.11.1 (Composition (Pairing)). Let **R** and **S** be relations. The *composition* of **R** and **S** is $\mathbf{S} \circ \mathbf{R} = \{(x,z) \mid \exists y.x\mathbf{R}y \wedge y\mathbf{S}z\}.$

Theorem 3.11.2 (Pairing, Union, Power Set, Subset). If R and S are small relations then $S \circ R$ is small.

PROOF: It is a subset of dom $R \times \operatorname{ran} S$. \square

Theorem 3.11.3 (Pairing). Let \mathbf{F} and \mathbf{G} be class terms. Then $\mathbf{G} \circ \mathbf{F}$ is a function, its domain is $\{x \in \text{dom } \mathbf{F} \mid \mathbf{F}(x) \in \text{dom } \mathbf{G}\}$, and for x in this domain, we have $(\mathbf{F} \circ \mathbf{G})(x) = \mathbf{F}(\mathbf{G}(x))$.

PROOF:

```
\langle 1 \rangle 1. \mathbf{G} \circ \mathbf{F} is a class term.
```

- $\langle 2 \rangle 1$. Let: $x(\mathbf{G} \circ \mathbf{F})z$ and $x(\mathbf{G} \circ \mathbf{F})z'$
- $\langle 2 \rangle 2$. Pick y, y' such that $x \mathbf{F} y, x \mathbf{F} y', y \mathbf{G} z$ and $y' \mathbf{G} z'$
- $\langle 2 \rangle 3. \ y = y'$

PROOF: Since \mathbf{F} is a class term.

 $\langle 2 \rangle 4. \ z = z'$

PROOF: Since **G** is a class term.

 $\langle 1 \rangle 2$. dom($\mathbf{G} \circ \mathbf{F}$) = { $x \in \text{dom } \mathbf{F} \mid \mathbf{F}(x) \in \text{dom } \mathbf{G}$ }

Proof:

$$x \in \text{dom}(\mathbf{G} \circ \mathbf{F}) \Leftrightarrow \exists z.x (\mathbf{G} \circ \mathbf{F})z$$

 $\Leftrightarrow \exists y, z.x \mathbf{F} y \land y \mathbf{G} z$
 $\Leftrightarrow x \in \text{dom } \mathbf{F} \land \mathbf{F}(x) \in \text{dom } \mathbf{G}$

 $\langle 1 \rangle 3$. For x in this domain, we have $(\mathbf{F} \circ \mathbf{G})(x) = \mathbf{F}(\mathbf{G}(x))$.

Proof: Take $[e, f) = [\max(a, c), \min(b, d))$.

Definition 10.7.7 (K-topology on the Real Line). Let $K = \{1/n \mid n \in \mathbb{Z}^+\}$.

The *K*-topology on the real line is the topology on \mathbb{R} generated by the basis consisting of all open intervals (a,b) and all sets of the form $(a,b) \setminus K$.

We write \mathbb{R}_K for the topological space \mathbb{R} under the K-topology.

The following example shows that Theorem 10.16.11 fails in the box topology.

Example 10.18.6. Define $f: \mathbb{R} \to \mathbb{R}^{\omega}$ by f(t) = (t, t, ...). Then $\pi_n \circ f = \mathrm{id}_{\mathbb{R}}$ is continuous for all n. But f is not continuous when \mathbb{R}^{ω} is given the box topology because the inverse image of

$$(-1,1) \times (-1/2,1/2) \times (-1/3,1/3) \times \cdots$$

is $\{0\}$ which is not open.

The following example shows that Proposition 10.16.10 fails in the box topology.

Example 10.18.7. Give \mathbb{R}^{ω} the box topology. Let $a_n = (1/n, 1/n, ...)$ for $n \geq 1$ and l = (0, 0, ...). Then $\pi_i(a_n) \to \pi_i(l)$ as $n \to \infty$ for all i, but $a_n \not\to l$ as $n \to \infty$ since the open set

$$(-1,1) \times (-1/2,1/2) \times (-1/3,1/3) \times \cdots$$

contains l but does not contain any a_n .

Example 10.18.8. The set \mathbb{R}^{∞} is closed in \mathbb{R}^{ω} under the box topology. For let (a_n) be any sequence not in \mathbb{R}^{∞} . Let U_n be an open interval around a_n that does not contain 0 if $a_n \neq 0$, and $U_n = \mathbb{R}$ if $a_n = 0$. Then $\prod_{n \geq 0} U_n$ is a neighbourhood of (a_n) that does not intersect \mathbb{R}^{∞} .

10.21 The First Countability Axiom

Definition 10.21.1 (First Countability Axiom). A topological space X satisfies the *first countability axiom*, or is *first countable*, if and only if every point has a countable local basis.

10.25 Quotient Topology

Definition 10.25.1 (Quotient Topology). Let X be a topological space, Y a set and $p: X \to Y$ be a surjective function. Then the *quotient topology* on Y is the unique topology on Y with respect to which p is a quotient map, namely $\mathcal{T} = \{U \in \mathcal{P}Y \mid p^{-1}(U) \text{ is open in } X\}.$

We prove this is a topology.

Definition 10.25.2 (Quotient Space). Let X be a topological space and \sim an equivalence relation on X. Let $p: X \to X/\sim$ be the canonical surjection. Then X/\sim under the quotient topology is called a *quotient space*, *identification space* or *decomposition space* of X.

Here is a counterexample showing we cannot remove all the hypotheses of Proposition 10.24.4 except that A is saturated.

Example 10.25.3. Let $X = (0, 1/2] \cup \{1\} \cup \{1 + 1/n : n \ge 2\}$ as a subspace of \mathbb{R} . Define R to be the equivalence relation on X where xRy iff (x = y) or |x - y| = 1, so we identify 1/n with 1 + 1/n for all $n \ge 2$. Let Y be the resulting quotient space X/R in the quotient topology and $p: X \to Y$ the canonical surjection.

Let $A = \{1\} \cup (0, 1/2] \setminus \{1/n : n \ge 2\} \subseteq X$. Then A is saturated under p but the restriction q of p to A is not a quotient map because it maps the saturated open set $\{1\}$ to $\{1\}$ which is not open in p(A).

Proposition 10.25.4. Let X, Y and Z be topological spaces. Let $f: X \to Y$ and $g: Y \to Z$. If f and g are quotient maps then so is $g \circ f$.

Proof: From Proposition 10.22.3. \square

Example 10.25.5. The product of two quotient maps is not necessarily a quotient map.

Let $X=\mathbb{R}$ and X^* the quotient space formed by identifying all positive integers. Let $p:X\twoheadrightarrow X^*$ be the canonical surjection.

We prove $p \times \mathrm{id}_{\mathbb{Q}} : X \times \mathbb{Q} \to X^* \times \mathbb{Q}$ is not a quotient map.

10.45 Countable Compactness

Definition 10.45.1 (Countably Compact). A topological space is *countably compact* if and only if every countable open covering has a finite subcovering.

Proposition 10.45.2 (AC). Every closed subspace of a countably compact space is countably compact.

Proof:

- $\langle 1 \rangle 1$. Let: X be a countably compact space.
- $\langle 1 \rangle 2$. Let: $A \subseteq X$ be closed.
- $\langle 1 \rangle 3$. Let: \mathcal{U} be a countable open cover of A.
- $\langle 1 \rangle 4$. For $U \in \mathcal{U}$, PICK an open set V_U is X such that $U = V_U \cap A$
- $\langle 1 \rangle 5$. $\{V_U \mid U \in \mathcal{U}\} \cup \{X A\}$ is a countable open cover of X
- $\langle 1 \rangle 6$. PICK a finite subcover $\{V_{U_1}, \ldots, V_{U_n}, X A\}$
- $\langle 1 \rangle 7. \ \{U_1, \dots, U_n\} \text{ covers } A.$

Proposition 10.45.3 (AC). Every countably compact space is limit point compact.

PROOF:

- $\langle 1 \rangle 1$. Assume: X is countably compact.
- $\langle 1 \rangle 2$. Let: $A \subseteq X$ be infinite.
- $\langle 1 \rangle 3$. Assume: for a contradiction A has no limit point.
- $\langle 1 \rangle 4$. PICK a countably infinite $B \subseteq A$
- $\langle 1 \rangle 5$. B is discrete.

PROOF: For all $b \in B$, there exists U_b open in X such that $U_b \cap B = \{b\}$.

- $\langle 1 \rangle 6$. $\{ \{b\} \mid b \in B \}$ is a countable cover of B that has no finite subcover.
- $\langle 1 \rangle 7$. B is not countably compact.
- $\langle 1 \rangle 8$. B is not closed in X

- $\langle 1 \rangle 9$. B has a limit point.
- $\langle 1 \rangle 10$. A has a limit point.
- $\langle 1 \rangle 11$. Q.E.D.

PROOF: This contradicts $\langle 1 \rangle 3$.

- $\langle 1 \rangle 2$. Let: $\{U_n \mid n \in \mathbb{Z}^+\}$ be a countable open cover of X.
- $\langle 1 \rangle 3$. For $n \in \mathbb{Z}^+$,

Let: $V_n = U_1 \cup \cdots \cup V_n$

- $\langle 1 \rangle 7$. PICK n such that $l \in U_n$
- $\langle 1 \rangle 8$. Case: $l = a_m$ for some $m \leq n$

PROOF: $U_n - \{a_1, \ldots, a_{m-1}, a_{m+1}, \ldots, a_n\}$ is a neighbourhood of l that intersects $\{a_n \mid n \in \mathbb{Z}^+\}$ only at l, contradicting $\langle 1 \rangle 6$.

 $\langle 1 \rangle 9$. Case: $l \neq a_m$ for any $m \leq n$

PROOF: $U_n - \{a_1, \ldots, a_n\}$ is a neighbourhood of l that does not intersect $\{a_n \mid n \in \mathbb{Z}^+\}$, which contradicts $\langle 1 \rangle 6$.

The following example shows we cannot remove the hypothesis that the space is T_1 .

Example 10.45.5. Let Y be the indiscrete space with two points. Then $\mathbb{Z}^+ \times Y$ is a limit point compact space that is not countably compact, since $\{\{n\} \times Y \mid n \in \mathbb{Z}^+\}$ is a countable open cover that has no finite subcover.

 - $\langle 2 \rangle 1$. Assume: X is countably compact.
 - $\langle 2 \rangle 2$. Let: $C_1 \supseteq C_2 \supseteq \cdots$ be a nested sequence of nonempty closed sets.
 - $\langle 2 \rangle 3$. Assume: for a contradiction $\bigcap_n C_n = \emptyset$
 - $\langle 2 \rangle 4$. $\{X C_n \mid n \in \mathbb{Z}^+\}$ covers X
 - $\langle 2 \rangle$ 5. Pick a finite subcover $\{X C_{n_1}, \dots, X C_{n_k}\}$ where $n_1 < \dots < n_k$
 - $\langle 2 \rangle 6. \ C_{n_k} = \emptyset$
 - $\langle 2 \rangle$ 7. Q.E.D.

PROOF: This contradicts $\langle 2 \rangle 2$.

- $\langle 1 \rangle 3$. If every nested sequence of nonempty closed sets has nonempty intersection then X is countably compact.
 - $\langle 2 \rangle 1.$ Assume: Every nested sequence of nonempty closed sets has nonempty intersection.
 - $\langle 2 \rangle 2$. Let: $\{U_n \mid n \geq 1\}$ is a countable open cover of X.

10.51 Local Compactness

Definition 10.51.1 (Locally Compact). Let X be a topological space and $x \in X$. Then X is *locally compact* at x if and only if there exists a compact subspace of X that includes a neighbourhood of x.

A space is *locally compact* if and only if it is locally compact at every point.

Example 10.51.2. The real line is locally compact, because for every real number x we have $x \in (x-1, x+1) \subseteq [x-1, x+1]$.

Example 10.51.3. For all $n \geq 1$, we have \mathbb{R}^n is locally compact. For any point $x = (x_1, \dots, x_n)$, we have $x \in (x_1 - 1, x_1 + 1) \times \dots \times (x_n - 1, x_n + 1) \subseteq [x_1 - 1, x_1 + 1] \times \dots \times [x_n - 1, x_n + 1]$.

The following example shows that a countable product of locally compact spaces is not necessarily locally compact.

Example 10.51.4. The space \mathbb{R}^{ω} is not locally compact.

 $\langle 1 \rangle 4$. Q.E.D.

PROOF: This is a contradiction.
