1 Order Theory

Definition 1 (Preorder)**.** Let X be a set. A *preorder* on X is a binary relation $\leq$ on X such that:

Reflexivity For all $x \in X$, we have $x \leq x$

Transitivity For all $x, y, z \in X$, if $x \leq y$ and $y \leq z$ then $x \leq z$.

Definition 2 (Preordered Set)**.** A *preordered set* consists of a set X and a preorder $\leq$ on X.

Definition 3 (Interval)**.** Let X be a preordered set and $Y \subseteq X$. Then Y is an *interval* if and only if, for all $a, b \in Y$ and $c \in X$, if $a \leq c \leq b$ then $c \in Y$.

2 Real Analysis

Definition 4. Let $\mathbb{R}^\infty$ be the subset of $\mathbb{R}^\omega$ consisting of all sequences (a_n) such that $a_n = 0$ for all but finitely many n.

3 Topological Spaces

Definition 5 (Topology). A *topology* on a set X is a set $\mathcal{T} \subseteq \mathcal{P}X$ such that:

- $X \in \mathcal{T}$.

- For all $\mathcal{U} \subseteq \mathcal{T}$ we have $\bigcup \mathcal{U} \in \mathcal{T}$.

- For all $U, V \in \mathcal{T}$ we have $U \cap V \in \mathcal{T}$.

We call the elements of X *points* and the elements of $\mathcal{T}$ *open sets*.

Definition 6 (Topological Space). A *topological space* X consists of a set X and a topology on X.

Definition 7 (Discrete Space). For any set X, the *discrete* topology on X is $\mathcal{P}X$.

Definition 8 (Indiscrete Space). For any set X, the *indiscrete* or *trivial* topology on X is $\{\emptyset, X\}$.

Definition 9 (Finite Complement Topology). For any set X, the *finite complement topology* on X is $\{U \in \mathcal{P}X \mid X \setminus U \text{ is finite}\} \cup \{\emptyset\}$.

Definition 10 (Countable Complement Topology). For any set X, the *countable complement topology* on X is $\{U \in \mathcal{P}X \mid X \setminus U \text{ is countable}\} \cup \{\emptyset\}$.

Definition 11 (Finer, Coarser). Suppose that $\mathcal{T}$ and $\mathcal{T}'$ are two topologies on a given set X. If $\mathcal{T}' \supseteq \mathcal{T}$, we say that $\mathcal{T}'$ is *finer* than $\mathcal{T}$; if $\mathcal{T}'$ *properly* contains $\mathcal{T}$, we say that $\mathcal{T}'$ is *strictly* finer than $\mathcal{T}$. We also say that $\mathcal{T}$ is *coarser* than $\mathcal{T}'$, or *stricly* coarser, in these two respective situations. We say $\mathcal{T}$ is *comparable* with $\mathcal{T}'$ if either $\mathcal{T}' \supseteq \mathcal{T}$ or $\mathcal{T} \supseteq \mathcal{T}'$.

Lemma 12. *Let X be a topological space and $U \subseteq X$. Then U is open if and only if, for all $x \in U$, there exists an open set V such that $x \in V \subseteq U$.*

Proof:
$\langle 1 \rangle 1. \Rightarrow$
  Proof: Take $V = U$
$\langle 1 \rangle 2. \Leftarrow$
  Proof: We have $U = \bigcup \{V \text{ open in } X \mid V \subseteq U\}$.
$\square$

Lemma 13. *Let X be a set and $\mathcal{T}$ a nonempty set of topologies on X. Then $\bigcap \mathcal{T}$ is a topology on X, and is the finest topology that is coarser than every member of $\mathcal{T}$.*

Proof:
$\langle 1 \rangle 1. \ X \in \bigcap \mathcal{T}$
  Proof: Since X is in every member of $\mathcal{T}$.
$\langle 1 \rangle 2. \ \bigcap \mathcal{T}$ is closed under union.

$\langle 2 \rangle 1$. Let: $\mathcal{U} \subseteq \bigcap \mathcal{T}$
$\langle 2 \rangle 2$. For all $T \in \mathcal{T}$ we have $\mathcal{U} \subseteq T$
$\langle 2 \rangle 3$. For all $T \in \mathcal{T}$ we have $\bigcup \mathcal{U} \in T$
$\langle 2 \rangle 4$. $\bigcup \mathcal{U} \in \bigcap \mathcal{T}$
$\langle 1 \rangle 3$. $\bigcap \mathcal{T}$ is closed under binary intersection.
$\quad \langle 2 \rangle 1$. Let: $U, V \in \bigcap \mathcal{T}$
$\quad \langle 2 \rangle 2$. For all $T \in \mathcal{T}$ we have $U, V \in T$
$\quad \langle 2 \rangle 3$. For all $T \in \mathcal{T}$ we have $U \cap V \in T$
$\quad \langle 2 \rangle 4$. $U \cap V \in \bigcap \mathcal{T}$
$\square$

Lemma 14. *Let X be a set and $\mathcal{T}$ a set of topologies on X. Then there exists a unique coarsest topology that is finer than every member of $\mathcal{T}$.*

Proof: The required topology is given by
$\bigcap \{T \in \mathcal{PP}X \mid T$ *is a topology on X that is finer than every member of $\mathcal{T}$*$\}$,
The set is nonempty since it contains the discrete topology. $\square$

Definition 15 (Neighbourhood)**.** A *neighbourhood* of a point x is an open set that contains x.

4 Closed Set

Definition 16 (Closed Set)**.** Let X be a topological space and $A \subseteq X$. Then A is *closed* if and only if $X \setminus A$ is open.

4. For all $C, D \in \mathcal{C}$ we have $C \cup D \in \mathcal{C}$.

Then there exists a unique topology $\mathcal{T}$ such that $\mathcal{C}$ is the set of closed sets, namely

$$\mathcal{T} = \{X \setminus C \mid C \in \mathcal{C}\}$$

PROOF:
$\langle 1 \rangle 1$. LET: $\mathcal{T} = \{X \setminus C \mid C \in \mathcal{C}\}$

    $\langle 3 \rangle 1$. LET: $\mathcal{U} \subseteq \mathcal{T}$

      PROOF: In this case $\bigcup \mathcal{U} = \emptyset \in \mathcal{T}$ since $X \in \mathcal{C}$
    $\langle 3 \rangle 3$. CASE: $\mathcal{U} \neq \emptyset$
      PROOF: In this case $X \setminus \bigcup \mathcal{U} = \bigcap \{X \setminus U \mid U \in \mathcal{U}\} \in \mathcal{C}$.

6 Closure

Definition 29 (Closure). Let X be a topological space and $A \subseteq X$. The *closure* of A, $\overline{A}$, is the intersection of all the closed sets that include A.

Proposition 39.
$$\overline{A} = \text{Int}\, A \cup \partial A$$

PROOF:
$$\begin{aligned}
\text{Int}\, A \cup \partial A &= \text{Int}\, A \cup (\overline{A} \cap \overline{X \setminus A}) \\
&= (\text{Int}\, A \cup \overline{A}) \cap (\text{Int}\, A \cup \overline{X \setminus A}) \\

PROOF: Let X be an indiscrete space. Let A be a set with more than one point and x be a point. The only neighbourhood of x is X, which must intersect A at a point other than x. $\square$

9   Basis for a Topology

Definition 46 (Basis). If X is a set, a *basis* for a topology on X is a set $\mathcal{B} \subseteq \mathcal{P}X$ called *basis elements* such that

If $\mathcal{B}$ satisfies these two conditions, then we define the topology *generated* by $\mathcal{B}$ to be $\mathcal{T} = \{U \in \mathcal{P}X \mid \forall x \in U.\exists B \in \mathcal{B}.x \in B \subseteq U\}$.

We prove this is a topology.

The following example shows that Theorem 118 fails in the box topology.

Example 142. Define $f : \mathbb{R} \to \mathbb{R}^\omega$ by $f(t) = (t, t, \ldots)$. Then $\pi_n \circ f = \mathrm{id}_\mathbb{R}$ is continuous for all n. But f is not continuous when $\mathbb{R}^\omega$ is given the box topology because the inverse image of

$$(-1, 1) \times (-1/2, 1/2) \times (-1/3, 1/3) \times \cdots$$

is $\{0\}$ which is not open.

The following example shows that Proposition 117 fails in the box topology.

Example 143. Give $\mathbb{R}^\omega$ the box topology. Let $a_n = (1/n, 1/n, \ldots)$ for $n \geq 1$ and $l = (0, 0, \ldots)$. Then $\pi_i(a_n) \to \pi_i(l)$ as $n \to \infty$ for all i, but $a_n \nrightarrow l$ as $n \to \infty$ since the open set

$$(-1, 1) \times (-1/2, 1/2) \times (-1/3, 1/3) \times \cdots$$

contains l but does not contain any a_n.

Example 144. The set $\mathbb{R}^\infty$ is closed in $\mathbb{R}^\omega$ under the box topology. For let (a_n) be any sequence not in $\mathbb{R}^\infty$. Let U_n be an open interval around a_n that does not contain 0 if $a_n \neq 0$, and $U_n = \mathbb{R}$ if $a_n = 0$. Then $\prod_{n \geq 0} U_n$ is a neighbourhood of (a_n) that does not intersect $\mathbb{R}^\infty$.

Example 174. This example shows we cannot remove the hypotheses on A and p.

Define $f : [0, 1] \rightarrow [2, 3] \rightarrow [0, 2]$ by $f(x) = x$ if $x \leq 1$, $f(x) = x - 1$ if $x \geq 2$. Then f is a quotient map but its restriction f' to $[0, 1) \cup [2, 3]$ is not, because $f'^{-1}([1, 2])$ is open but $[1, 2]$ is not.

For a counterexample where A is saturated, see Example 179.

26 Quotient Topology

Definition 177 (Quotient Topology)**.** Let X be a topological space, Y a set and $p : X \twoheadrightarrow Y$ be a surjective function. Then the *quotient topology* on Y is the unique topology on Y with respect to which p is a quotient map, namely $\mathcal{T} = \{U \in \mathcal{P}Y \mid p^{-1}(U) \text{ is open in } X\}$.

We prove this is a topology.

PROOF:
$\langle 1 \rangle$1. $Y \in \mathcal{T}$
    PROOF: Since $p^{-1}(Y) = X$ by surjectivity.
$\langle 1 \rangle$2. For all $\mathcal{A} \subseteq \mathcal{T}$ we have $\bigcup \mathcal{A} \in \mathcal{T}$
    PROOF: Since $p^{-1}(\bigcup \mathcal{A}) = \bigcup_{U \in \mathcal{A}} p^{-1}(U)$

□

Definition 178 (Quotient Space)**.** Let X be a topological space and $\sim$ an equivalence relation on X. Let $p : X \twoheadrightarrow X/\sim$ be the canonical surjection. Then $X/\sim$ under the quotient topology is called a *quotient space*, *identification space* or *decomposition space* of X.

Here is a counterexample showing we cannot remove all the hypotheses of Proposition 173 except that A is saturated.

Example 179. Let $X = (0, 1/2] \cup \{1\} \cup \{1 + 1/n : n \geq 2\}$ as a subspace of $\mathbb{R}$. Define R to be the equivalence relation on X where xRy iff ($x = y$ or $|x-y| = 1$),

so we identify $1/n$ with $1 + 1/n$ for all $n \geq 2$. Let Y be the resulting quotient space X/R in the quotient topology and $p : X \twoheadrightarrow Y$ the canonical surjection.

Let $A = \{1\} \cup (0, 1/2] \setminus \{1/n : n \geq 2\} \subseteq X$. Then A is saturated under p but the restriction q of p to A is not a quotient map because it maps the saturated open set $\{1\}$ to $\{1\}$ which is not open in $p(A)$.

Proposition 180. *Let X, Y and Z be topological spaces. Let $f : X \to Y$ and $g : Y \to Z$. If f and g are quotient maps then so is $g \circ f$.*

PROOF: From Proposition 165. □

Let $X = \mathbb{R}$ and X^* the quotient space formed by identifying all positive integers. Let $p : X \twoheadrightarrow X^*$ be the canonical surjection.

We prove $p \times \mathrm{id}_{\mathbb{Q}} : X \times \mathbb{Q} \to X^* \times \mathbb{Q}$ is not a quotient map.

31 Isometric Imbeddings

Definition 236. Let X and Y be metric spaces. An *isometric imbedding* $f : X \to Y$ is a function such that, for all $x, y \in X$, we have $d(f(x), f(y)) = d(x, y)$.

Proposition 237. *Every isometric imbedding is an imbedding.*

PROOF:
$\langle 1 \rangle 1$. LET: $f : X \to Y$ be an isometric imbedding.
$\langle 1 \rangle 2$. f is injective.
   PROOF: If $f(x) = f(y)$ then $d(f(x), f(y)) = 0$ hence $d(x, y) = 0$ hence $x = y$.
$\langle 1 \rangle 3$. f is continuous.
   PROOF: For all $\epsilon > 0$, if $d(x, y) < \epsilon$ then $d(f(x), f(y)) < \epsilon$.
$\langle 1 \rangle 4$. $f : X \to f(X)$ is an open map.
   PROOF: $f(B(a, \epsilon)) = B(f(a), \epsilon) \cap f(X)$.
